RadioPro provides best-in-class VoIP for two-way digital radios to allow communication from anywhere on conventional or trunked systems. RadioPro combines the flexibility to solve any Radio-over-IP challenge, ease of wide-area system deployment, and cost savings over other solutions. Enhance radio system functionality with the following RadioPro software applications for Windows™ PCs and notebooks and smart mobile devices.

RadioPro Dispatch is a multi-channel Windows™ desktop console, with optional modules for GPS tracking, voice dispatch, text messaging, and more!

RadioPro Talk is a low-cost alternative to tone-remotes, giving its users the functionality of a virtual radio on a Windows™ desktop, while focusing on simplicity.

RadioPro Mobile, is available for iOS and Android devices, enabling mobile users communication with two-way radios using simple push-to-talk.

Maximizing productivity on the plant floor or in the field starts with reliable communication. Linking operations between a central office, production facilities and all the areas in between is essential for operational efficiency. Affordable and easy to use, RadioPro software will enable your crew to easily communicate with field personnel on as many as 40 channels simultaneously.

Whether a radio user is at a central office, or traveling between sites, RadioPro Dispatch provides managers easy access to their work crew. Features such as superb audio quality intuitive interface, selected and un-selected audio, missed-call tracking, instant playback, man-down emergency call, and patching improve immediate communication for increased productivity and emergency situation preparedness.

Monitor worker safety with lone worker and man-down emergency alarms. These digital two-way radio manufacturer solutions integrate easily with RadioPro and can emit tones from the radio to allow the radio to call for help when a worker is not able. In addition, the integrated GPS module allows administrators to track the location of their crew by displaying a radio user's position on a map.

CTI Products' RadioPro software includes the RadioPro Mobile application for iPhone and Android. This application allows users to reliably communicate with two-way radio systems from anywhere, twenty-four hours a day, seven days a week. Response time never been more immediate.

Since all voice calls, text messages, and GPS data is logged to the database, reports and safety incident review are available. Management teams can easily search, filter and review events recorded on a particular scene. Voice calls of interest may be merged together for a seamless replay of an incident. Reports are also available to show how long a driver stops at a location, a driver's speed during travel, a user's radio voice call usage, and other important safety monitoring data.

CTI Products is pleased to announce the merger of two of its software applications. TurboVUi and RadioPro were introduced to provide digital two-way radio users with a means to enhance their digital radio communication. TurboVUi will soon be incorporated into *RadioPro* to strengthen our product offerings. RadioPro will offer all of the features and benefits TurboVUi users have come to expect, including the same high quality service.
